

Walker V, Tranquille C, Newton R, Dyson S, Brandham J, Northrop A & Murray, R. Comparison of limb kinematics between collected and lengthened (medium/extended) trot in two groups of dressage horses on two different surfaces. Equine Vet J. 2016, Accepted

Murray R, Guire R, Fisher M & Fairfax V. Reducing peak pressures under the saddle panel at the level of the thirteenth thoracic vertebra may be associated with improved gait features, even when saddles are fitted to published guidelines. Equine vet. J. S50, 23-24.

Can we use subchondral bone thickness on high-field MR images to identify Thoroughbred racehorses at risk of catastrophic lateral condylar fracture? Equine vet J. 2016 doi:10.1111/evj.12574

Association of a subjective muscle score with increased angles of flexion during sitting trot in dressage horses. (2016) J Equine Vet Science. 40, 6-15

A bridle designed to avoid peak pressure locations under the headpiece and noseband is associated with more uniform pressure and increased carpal and tarsal flexion, compared with the horse’s usual bridle. J Equine Vet Science. (2015) 35; 947-955.

The effect of collection and extension on tarsal flexion and fetlock extension at trot. Equine vet J (2013) 45 (2) 245-248

Girth pressure measurements reveal high peak pressures that can be avoided using an alternative girth design that also results in increased limb protraction and flexion in the swing phase. The Vet J (2013) 198 (1) 92-97.
